

# **Okay, I've Automated. What Now?**

**Matt Oswalt**

**@Mierdin**

**keepingitclassless.net**

# Network Automation Today

- YAML Files
- Templates
- Automation tools like Ansible

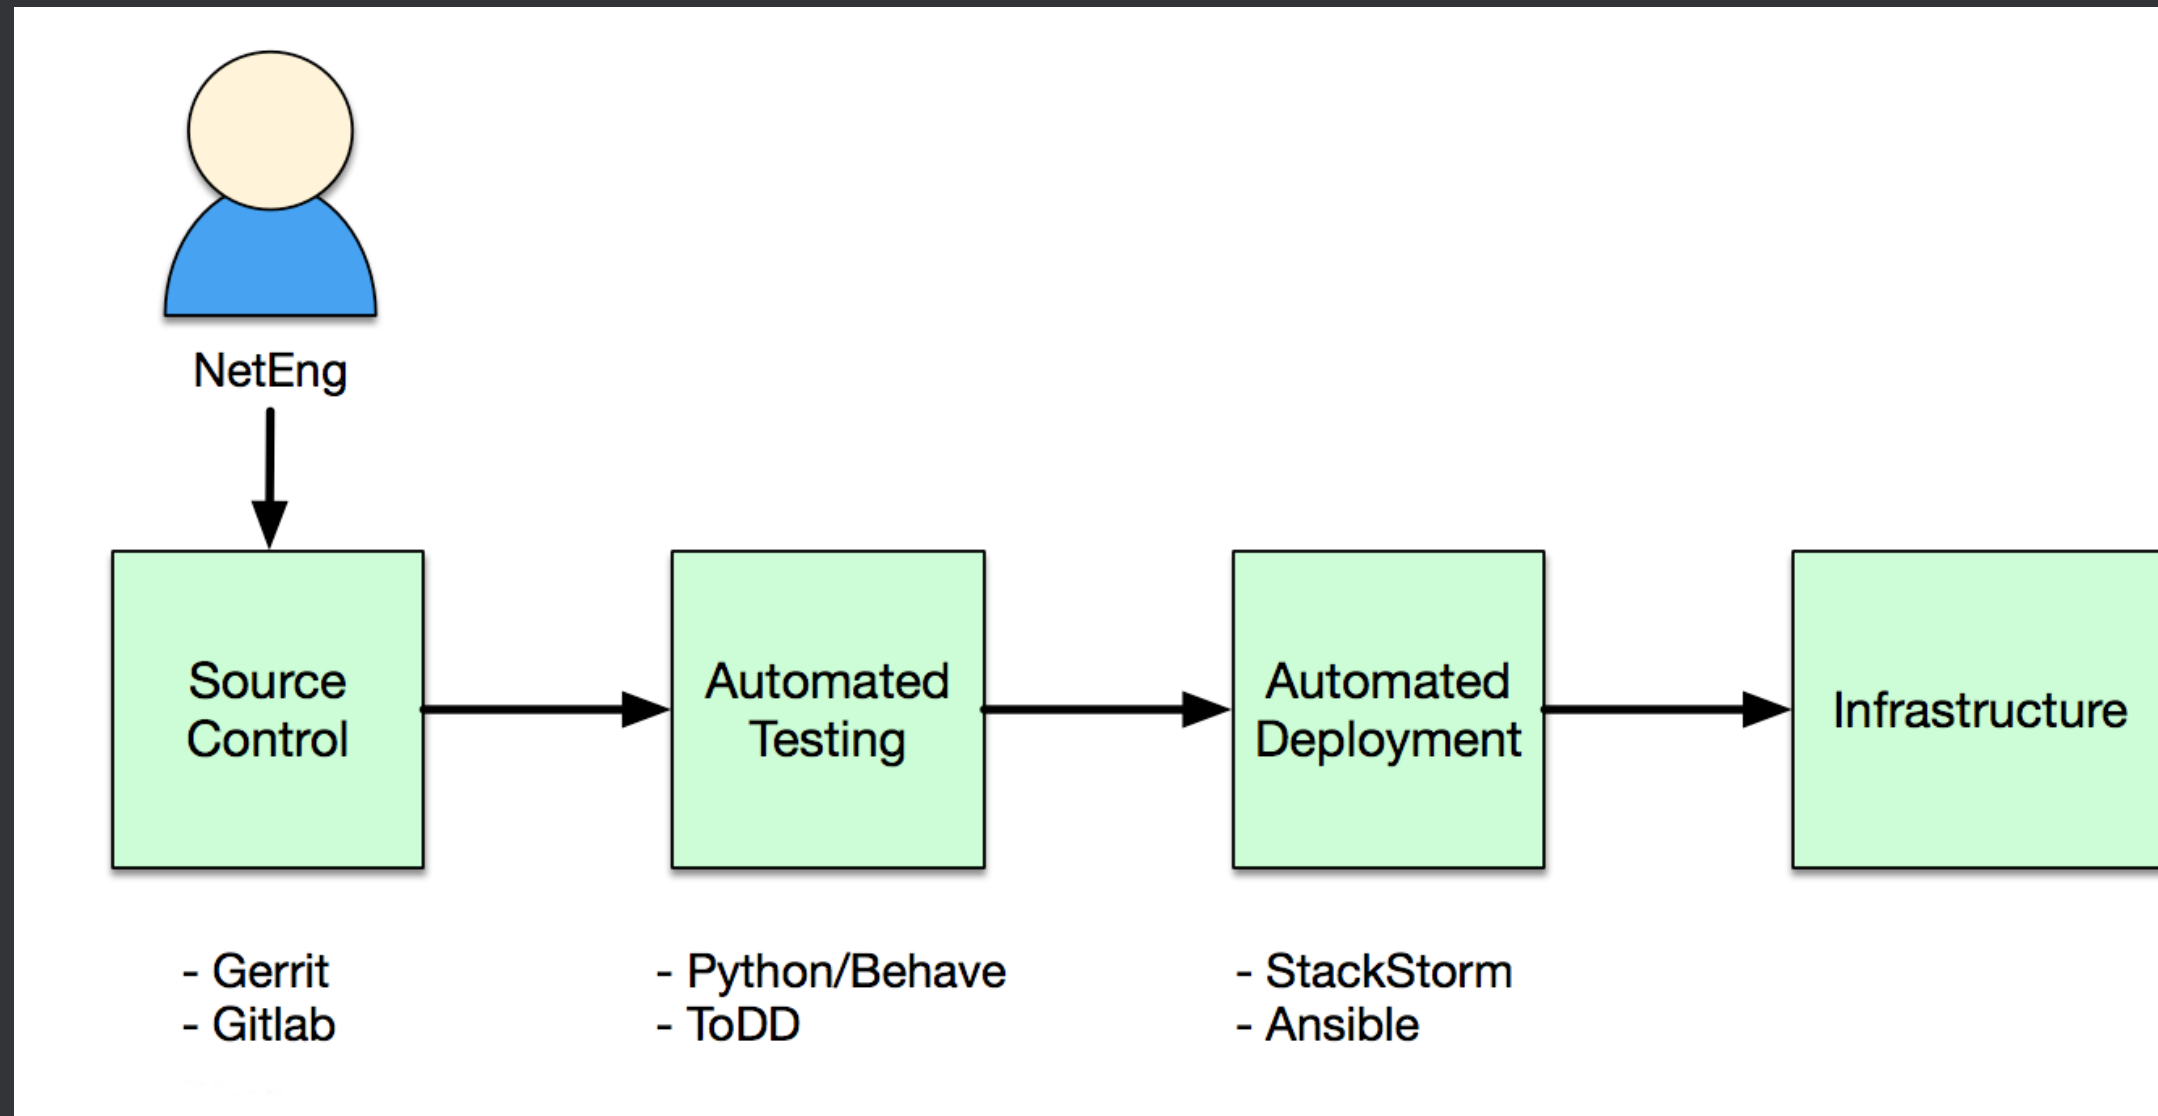

# Important Questions

- What determines **success**?
- We've changed our tools, what about process?

# Topics

- Test-Driven Network Automation
- Event-Driven Network Automation

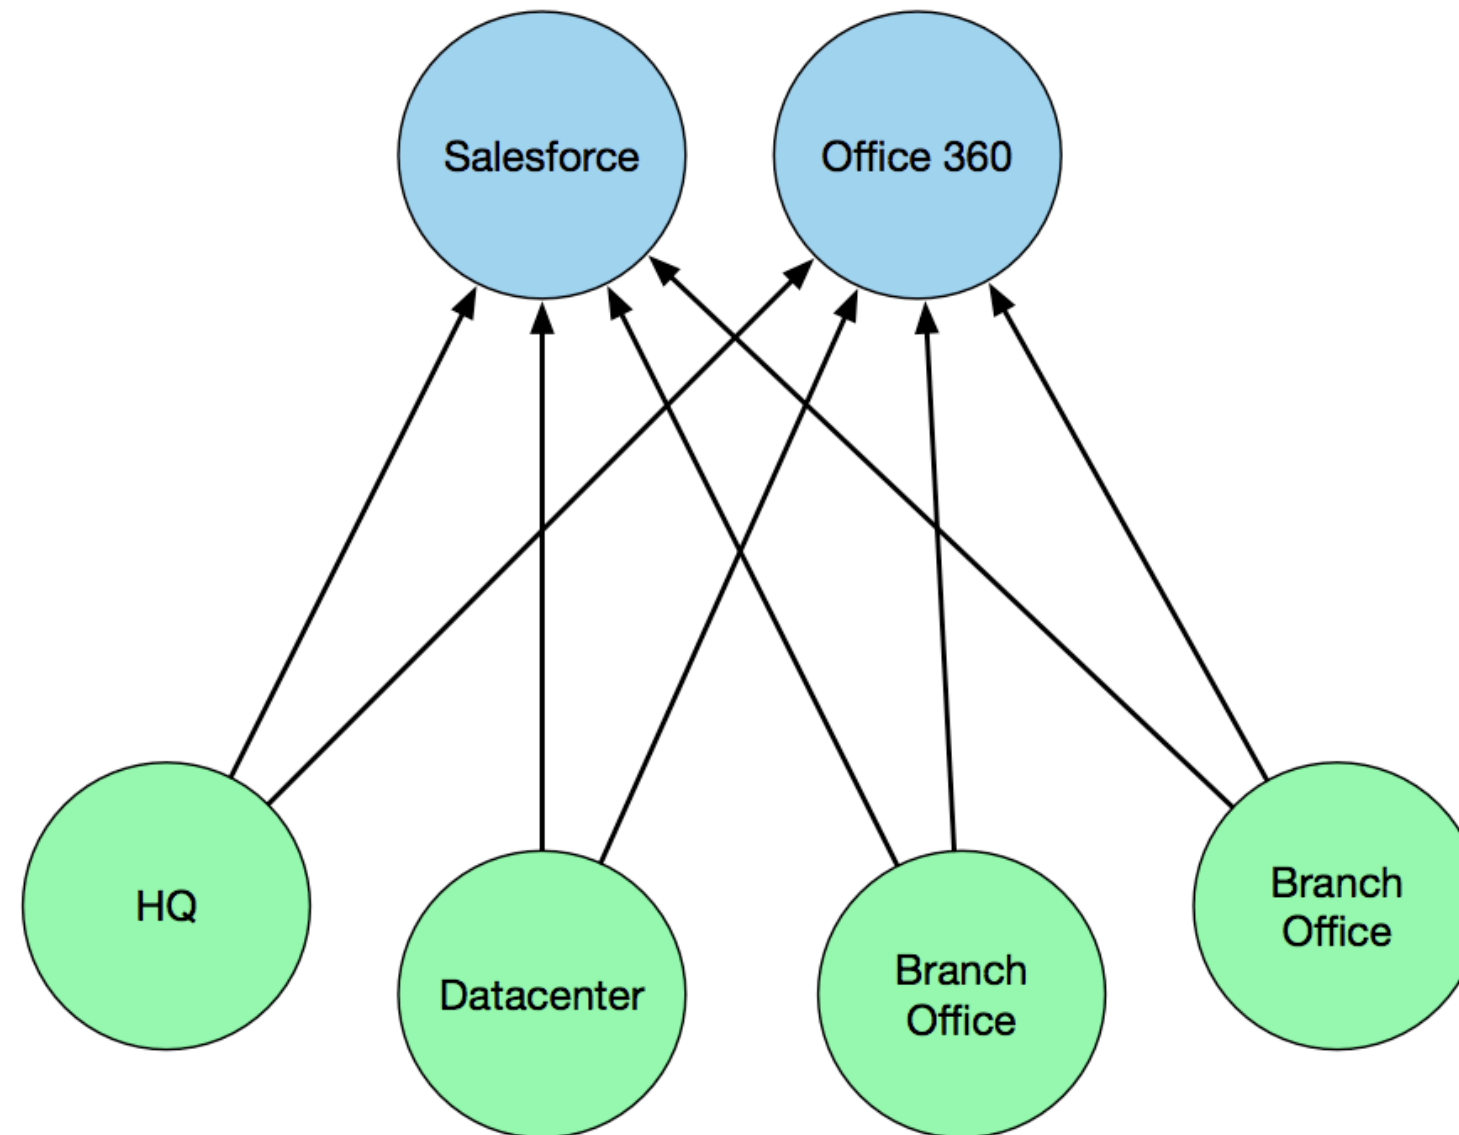

# Test-Driven Network Automation

# ToDD: High-Level Overview

- Perform tests and gather data from agents distributed throughout your infrastructure
- Highly extensible testing. Could feasibly support any application
- Scale out - testing becomes more powerful by simply spinning up more agents
- Perform testing ad-hoc, or trending over time

# Use Case - SaaS Monitoring

HTTP Metrics From Each Location (curl)

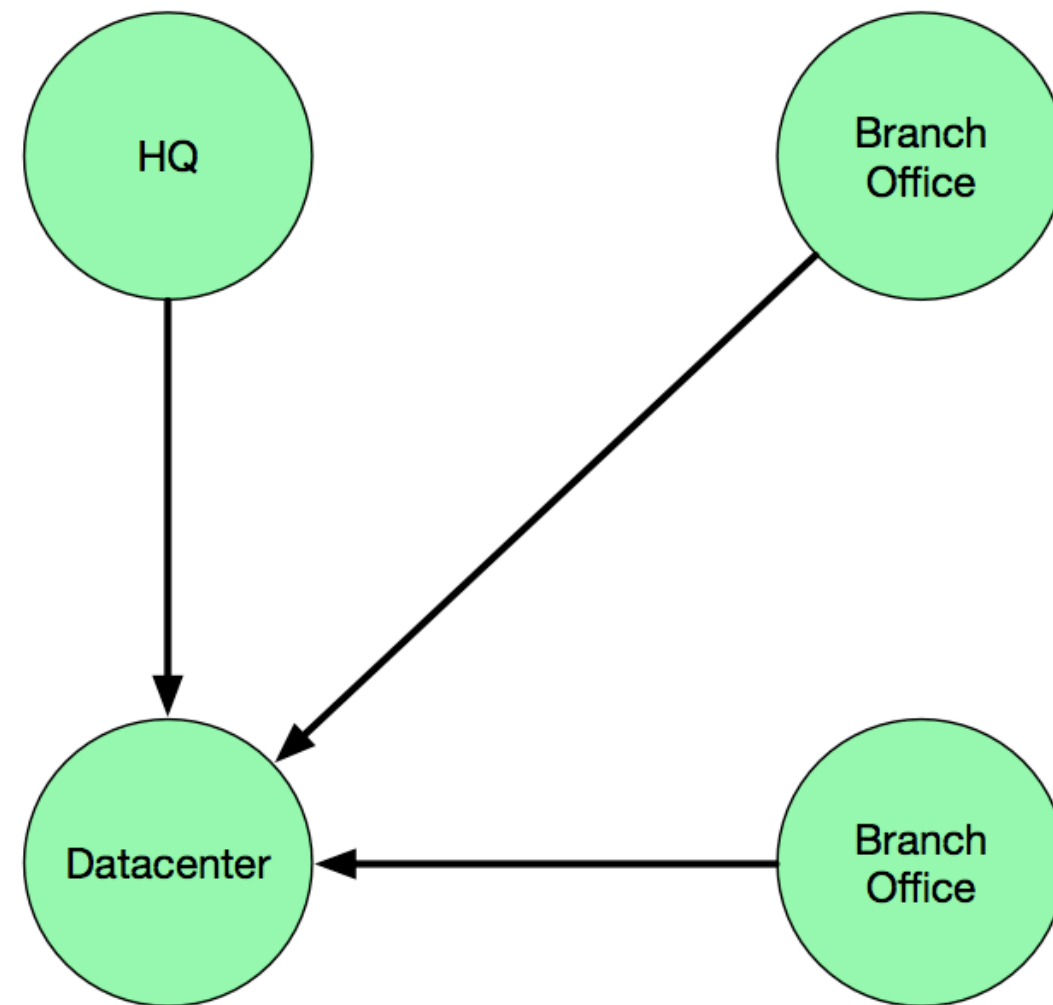

# Use Case - "Network Integration Testing"

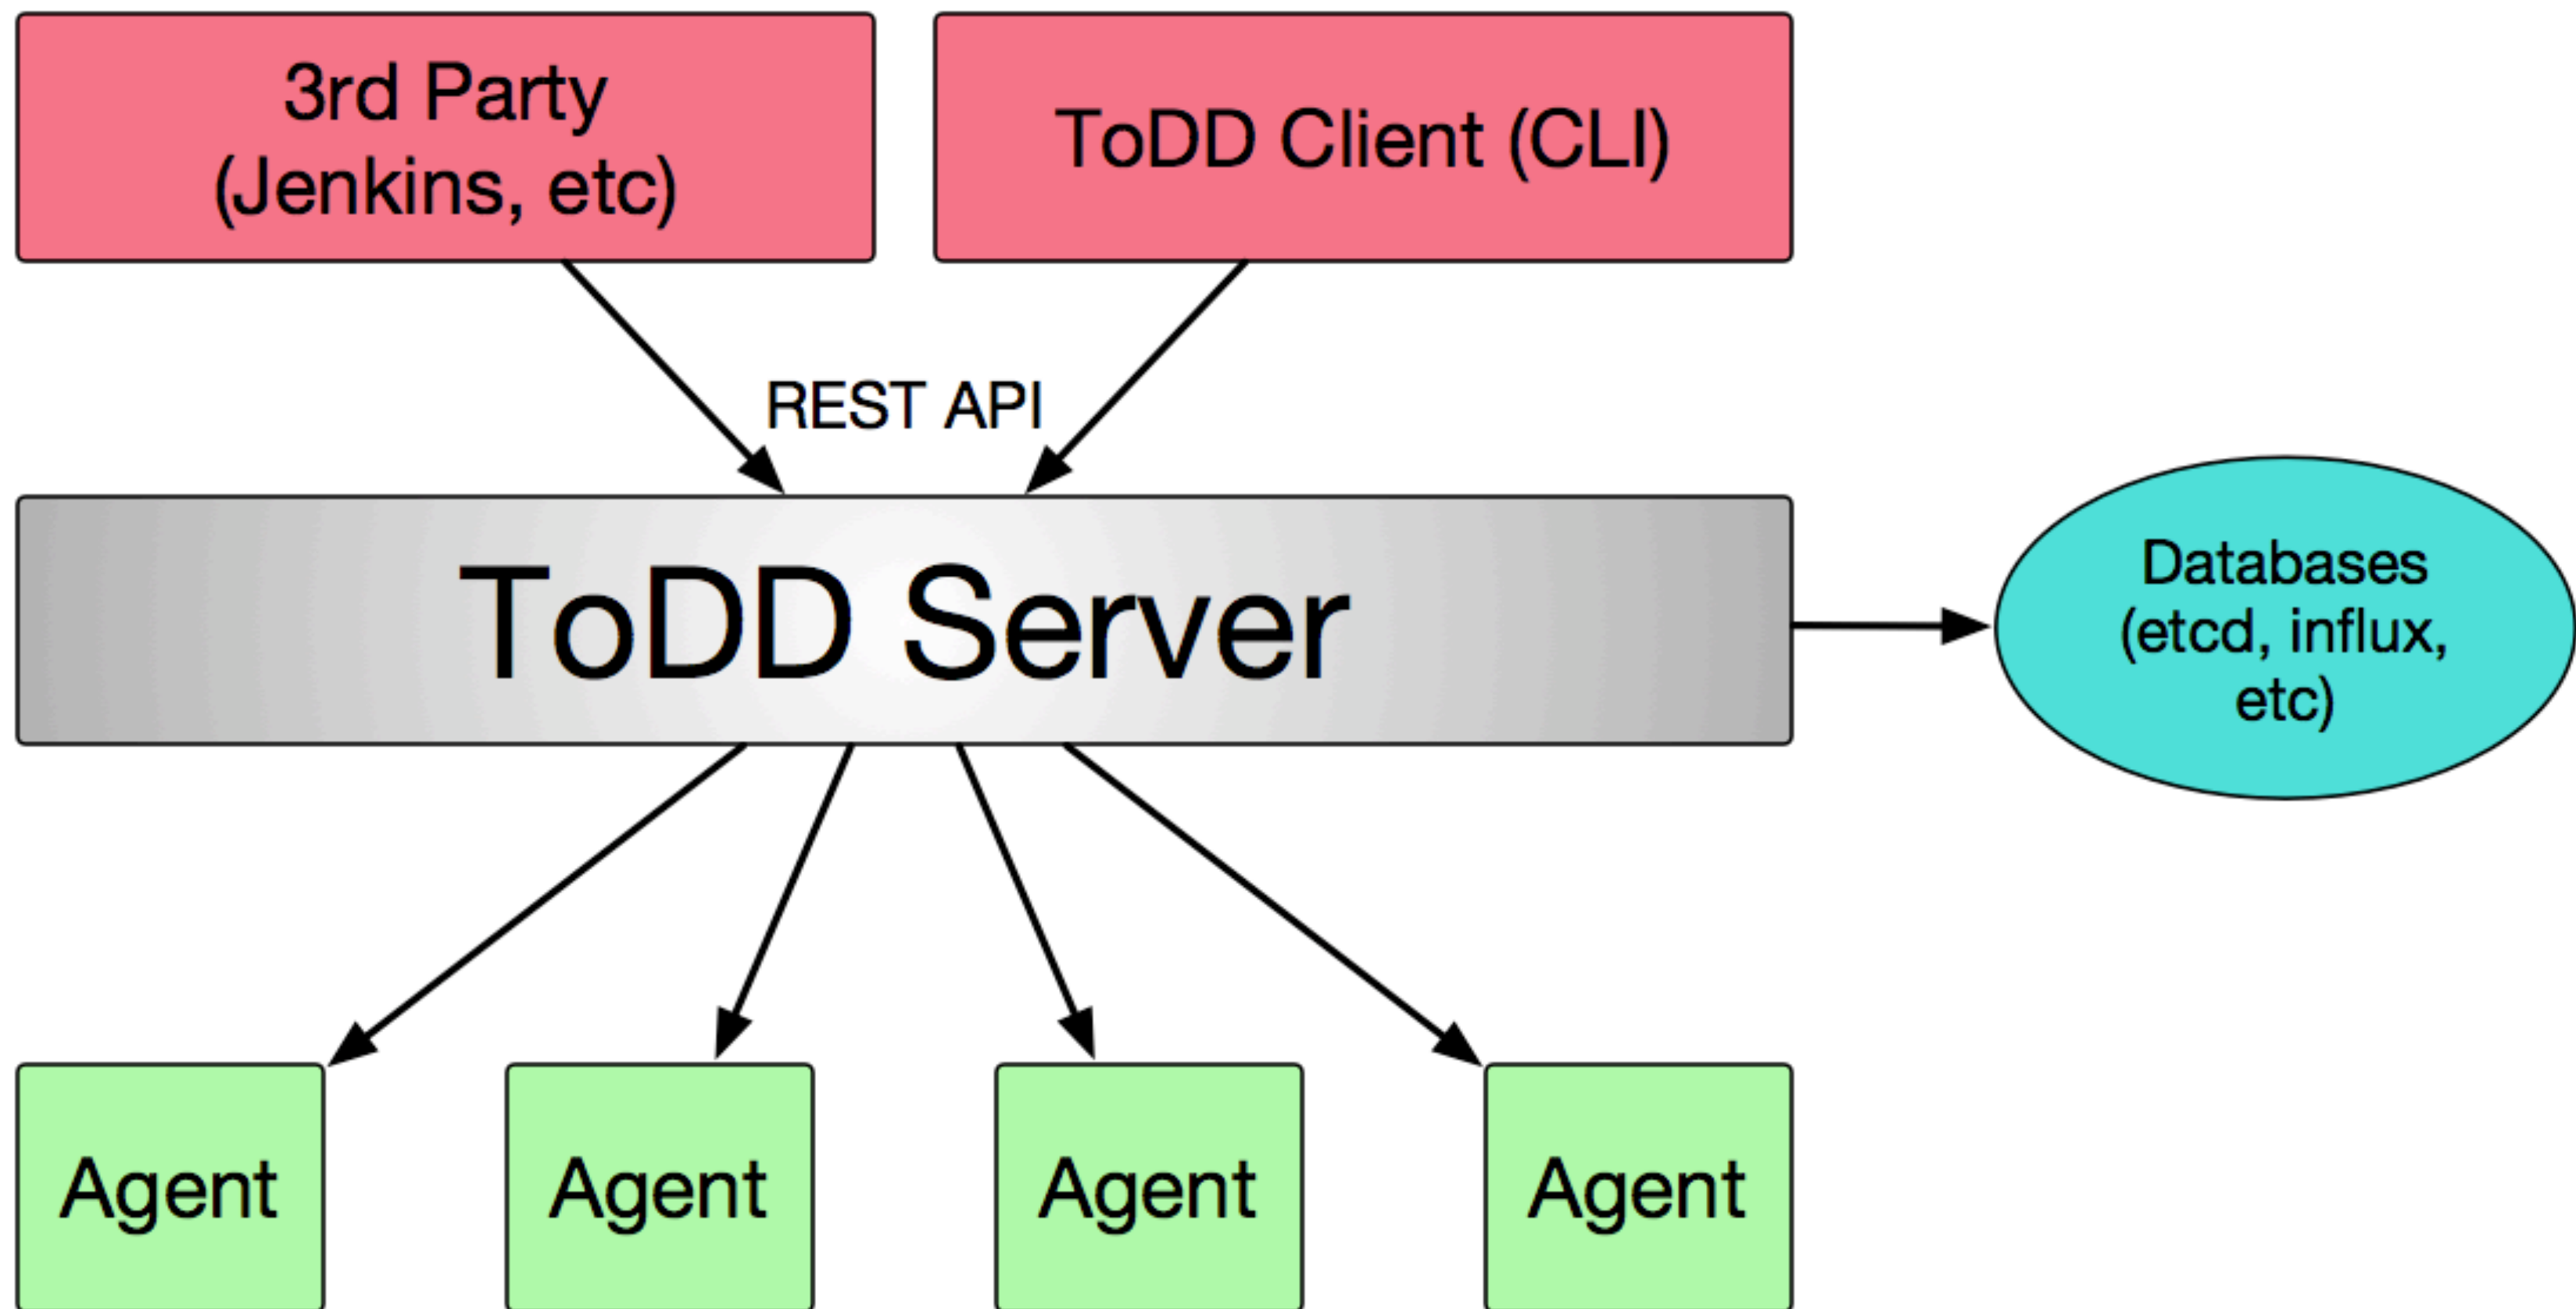

Available Bandwidth Between Locations (iperf)

# Use Case - Enhanced Troubleshooting

Specific, Ad Hoc Test for NetEng Troubleshooting activities (any)

# ToDD: Server

- Orchestrates test runs between groups of agents (not part of test)
- Manages agent registration and remediation
- Interacts with databases
- Manages group topology
- Provides HTTP API to the ToDD client and 3rd party software

# ToDD: Agents

- Provides facts about operating environment back to server
- Receives and executes testrun instructions from server
- Variety of form factors (baremetal, VM, container, RasPi, network switch)
